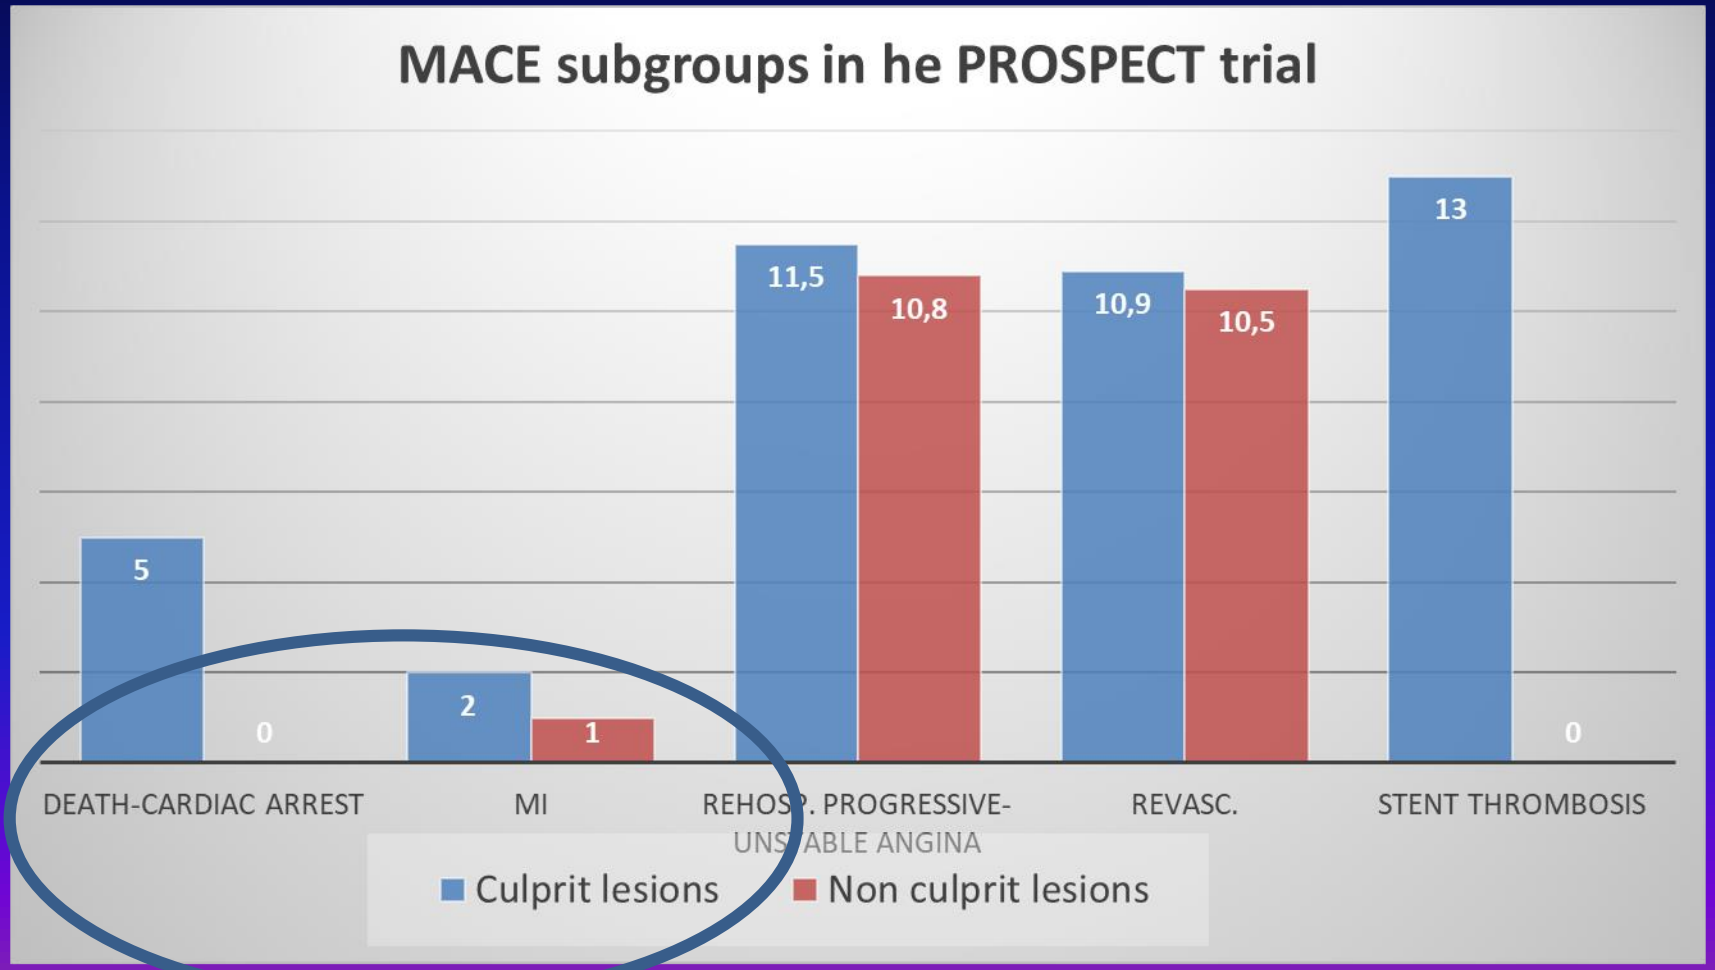
3-year cumulative rate of MACE in 697 patients with ACS and gray-scale plus radiofrequency intravascular three-vessel coronary assessment



EDITORIAL COMMENT

# Vulnerable Plaque and Einstein's Definition of Insanity*

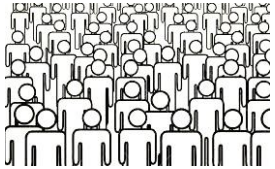
Steven E. Nissen, MD

A quote often attributed to Albert Einstein defines insanity as "doing the same thing over and over again and expecting different results." That's exactly what has happened with efforts to identify the elusive entity of "vulnerable plaque" using various coronary imaging modalities. Proponents of this concept have tried for decades to

abnormal temperature readings in the coronary arteries of patients with unstable syndromes. Then, almost inexplicably, silence.

The rise and fall of coronary thermography is emblematic of a pattern that has recurred repeatedly during the last 2 decades. The list of failed techniques for vulnerable plaque detection seems almost

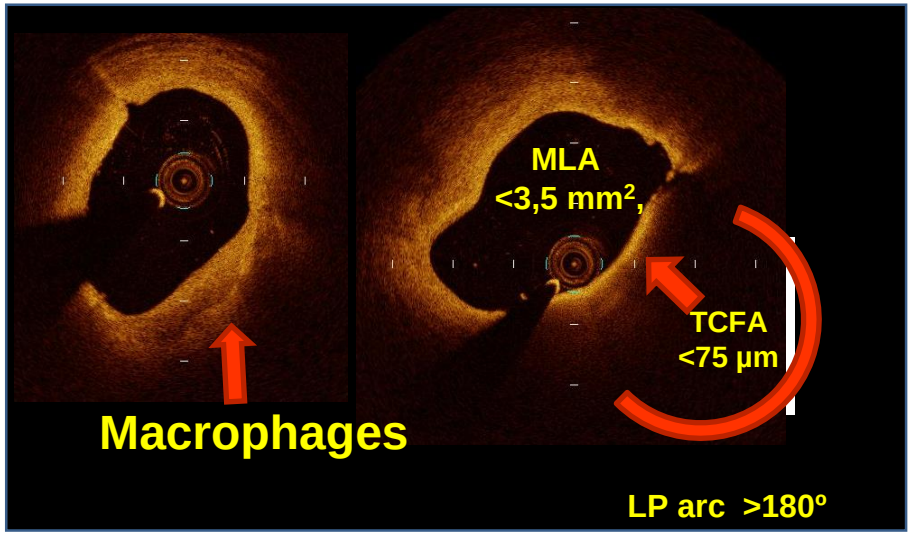
Nissen SE. JACC. 2020;75:1383-1385.



# CLIMA Study

OCT LAD in 1003 patients with clinically indicated coronary angiogram from 11 independent centres enrolled from January 2013 to December 2016

MLA $<3.5mm^2$ + FCT <75µm + Lipid arc circ. extension >180° + OCT defined macrophages



In 19.4% of patients who experienced the primary end-point the combination of the 4 findings was an independent predictor of events (HR 7.54, CI 95% 3.1-18.6).

EDITORIAL

# Forget Ischemia: It's All About the Plaque

David E. Newby, DM, PhD; Michelle C. Williams, MBChB, PhD; Marc R. Dweck, MD, PhD

The introduction of invasive coronary angiography in the 1960s was a major step forward in the understanding and treatment of coronary artery disease. However, high initial complication rates and limited availability led to the widespread development of ischemia testing techniques as safer, noninvasive surrogate methods of identifying obstructive coronary

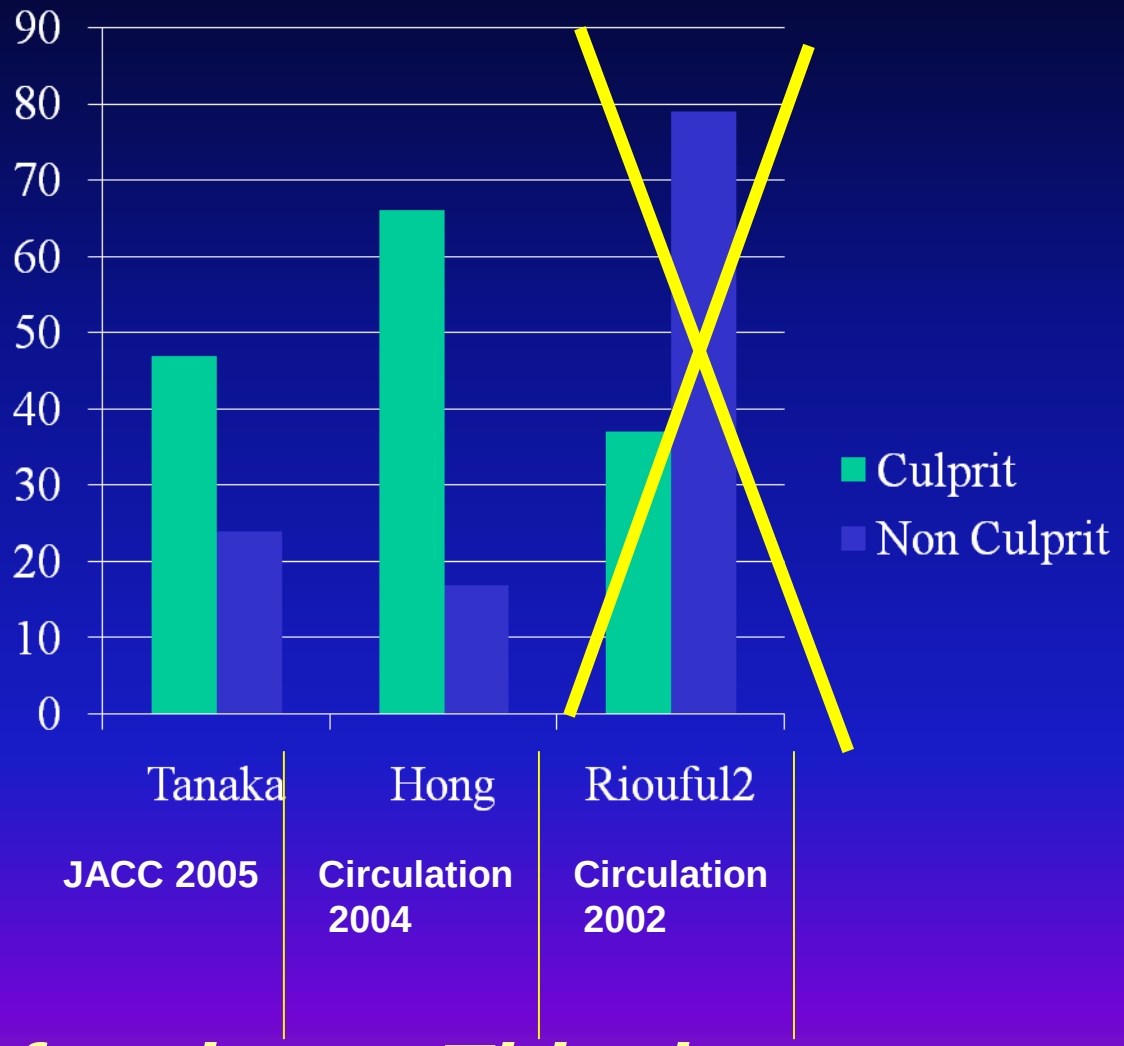
nostic benefit was found from coronary revascularization in patients with stable coronary artery disease and myocardial ischemia after a median of 3 years of follow-up.[3]

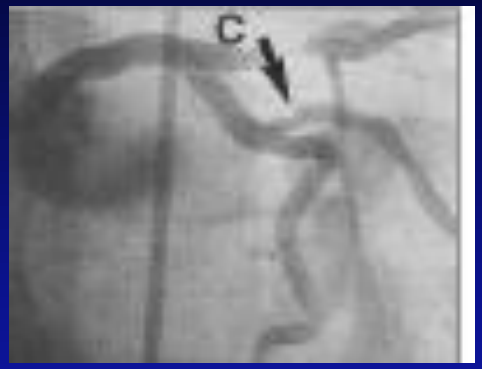
In this issue of *Circulation*, 2 important substudies of ISCHEMIA are presented by Reynolds et al.[4,5] In one analysis,[4] ISCHEMIA investigators examined both the prognostic predictive power and the potential trial

*Circulation*. 2021;144:1039–1041. DOI: 10.1161/CIRCULATIONAHA.121.054102

*It seems worthless any attempt to stabilize plaques if silent ruptures occur often and plaque phenotypes are too dynamic to become a reliable* target .

# Plaque rupture without trhrombus in culprit e non culprit lesions in pts with ACS. IVUS imaging of the 3 main vessels



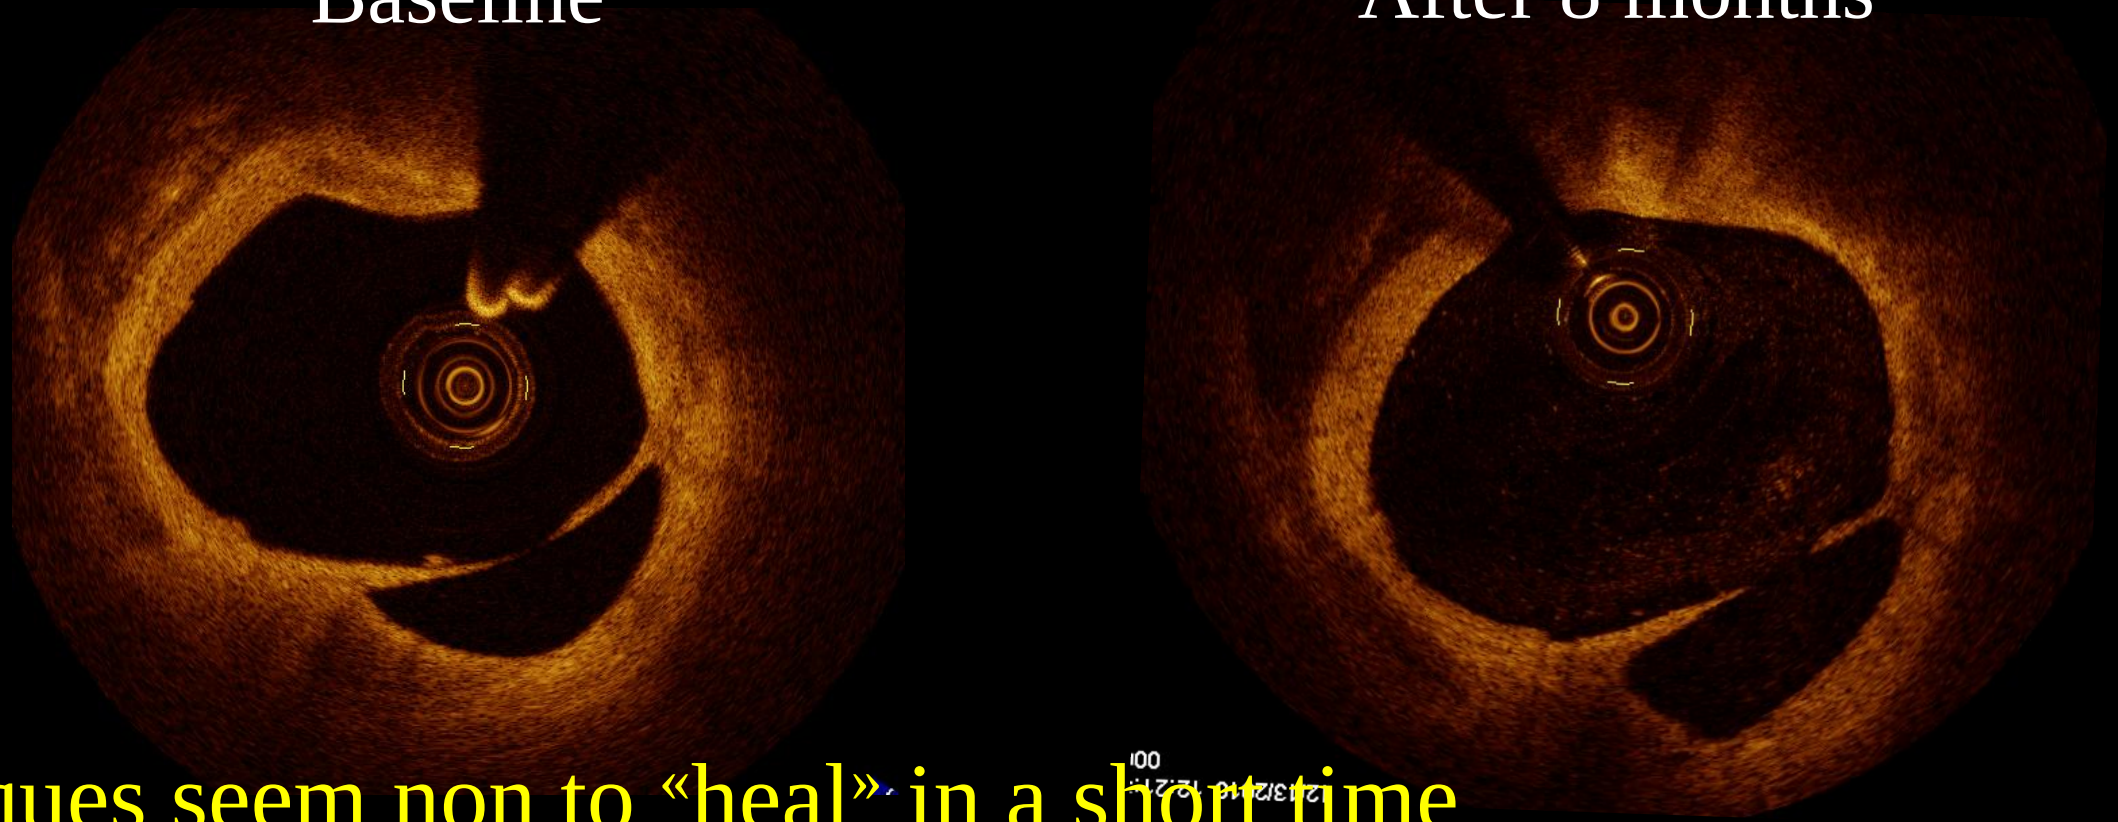


***30% of patients. This does not seem a trivial number.***

*Anectodal cases, based on sequential imaging studies, showed that plaque ulcers can remain stable for months or years.*

Baseline

After 8 months



Plaques seem non to «heal» in a short time

Di. Vito et al. JACC Imaging 2013

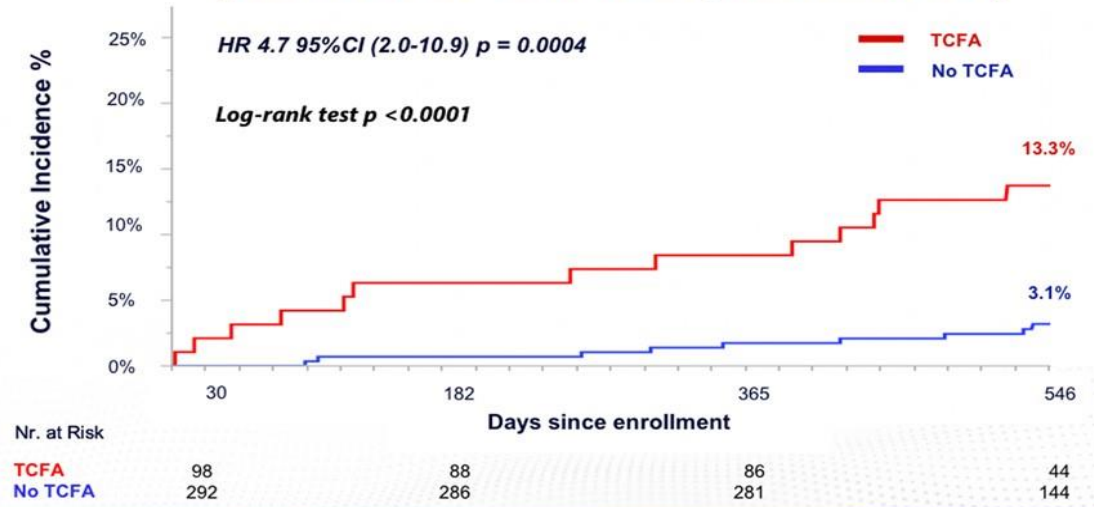
- *Does a snapshot of plaque characteristics at a certain point make sense?*

- *Plaques can lose their "vulnerability" characteristics in response to therapy or, vice versa, get worse over a few months in untreated patients.*

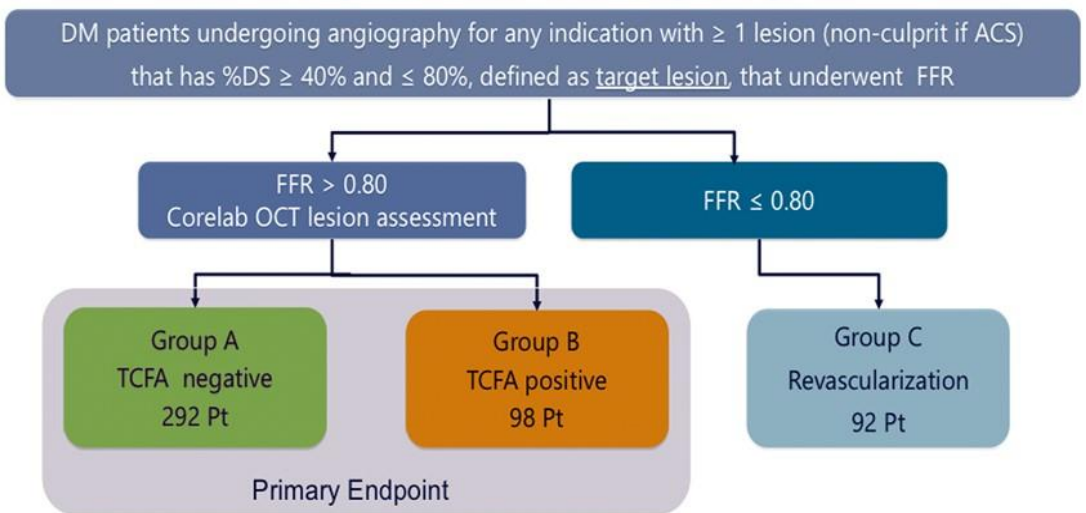
# Combined *Optical Coherence Tomography* and *Fractional Flow Reserve* Assessment to Better Predict Adverse Event Outcomes in DM Patients COMBINE (FFR–OCT) Trial

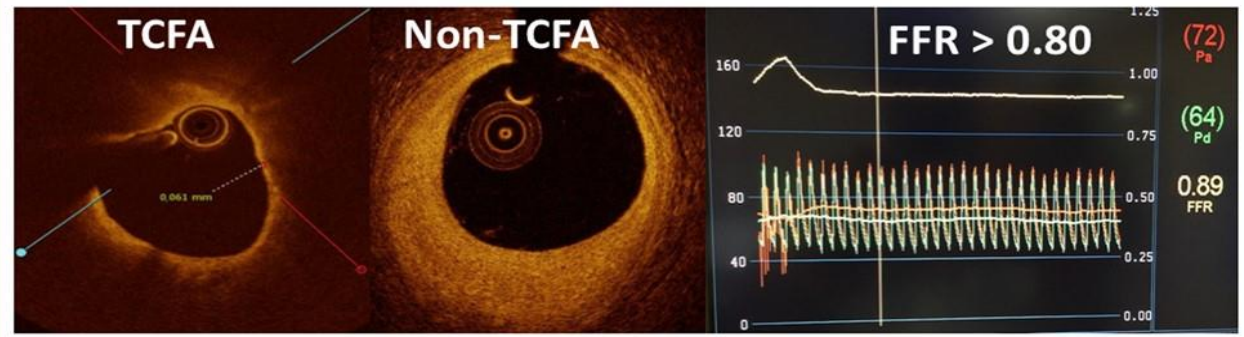
***Aim:*** **to explore the hypothesis that in patients with fast progressing atherosclerosis like DM patients, identification of TCFAs may be more important than ruling out the presence of flow-limiting lesions in predicting future MACE**

## Primary Endpoint
### (CD, TVMI, CD-TLR, or Hospitalization UAP)



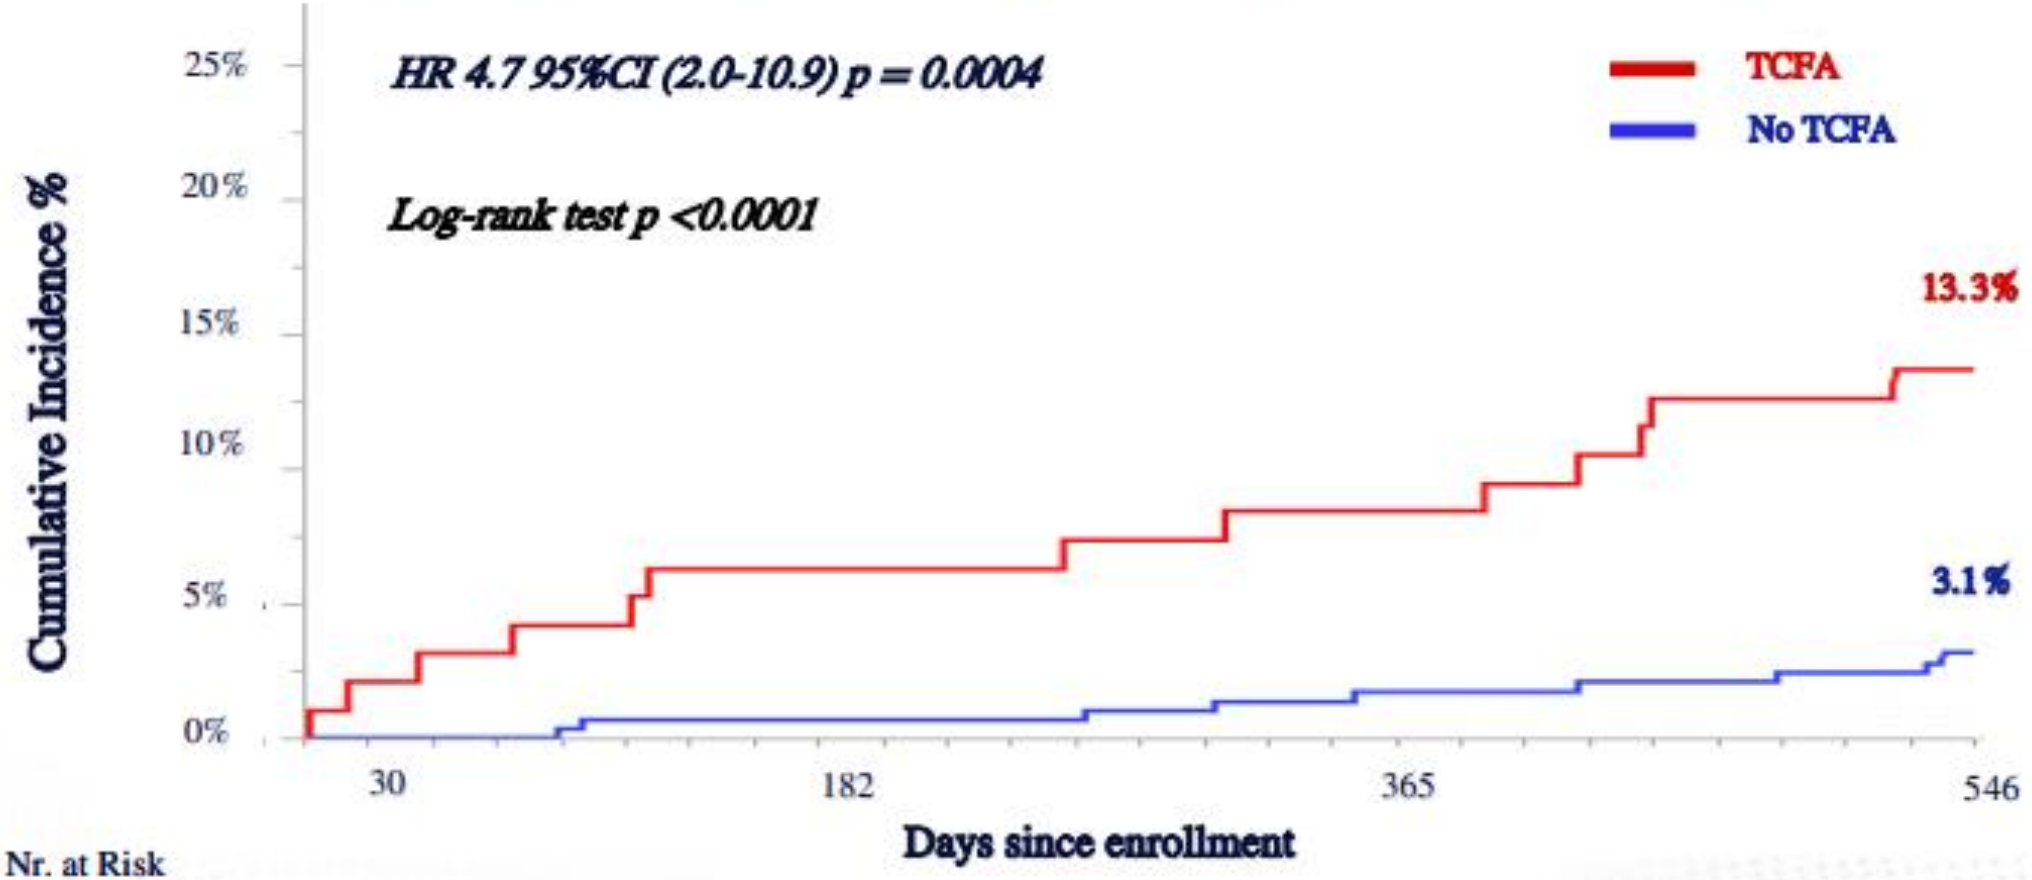
## COMBINE (FFR-OCT) Design
### Prospective Natural History Study





***Conclusions:*** **In DM patients, TCFA represents 25% of FFR-negative lesions and OCT-detected TCFA is associated with a 5-fold higher rate of adverse events despite the absence of ischemia**

# Primary Endpoint
## (CD, TVMI, CD-TLR, or Hospitalization UAP)



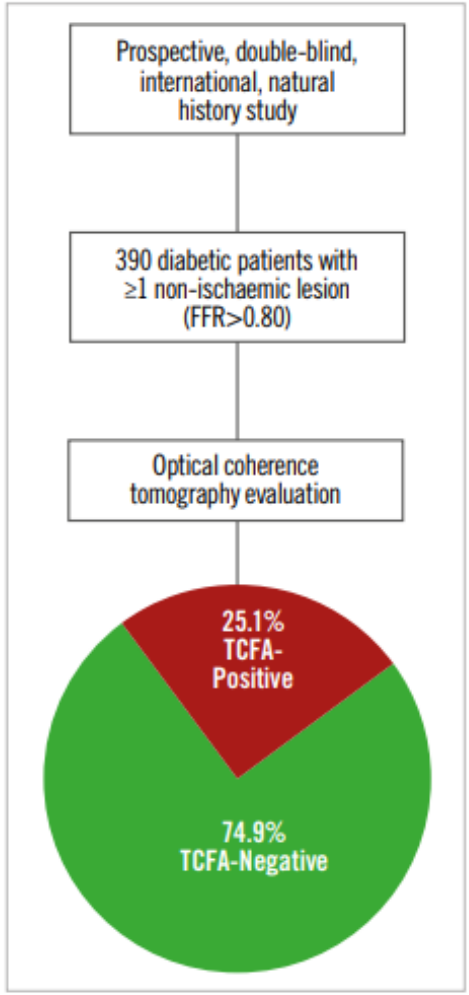
Nr. at Risk

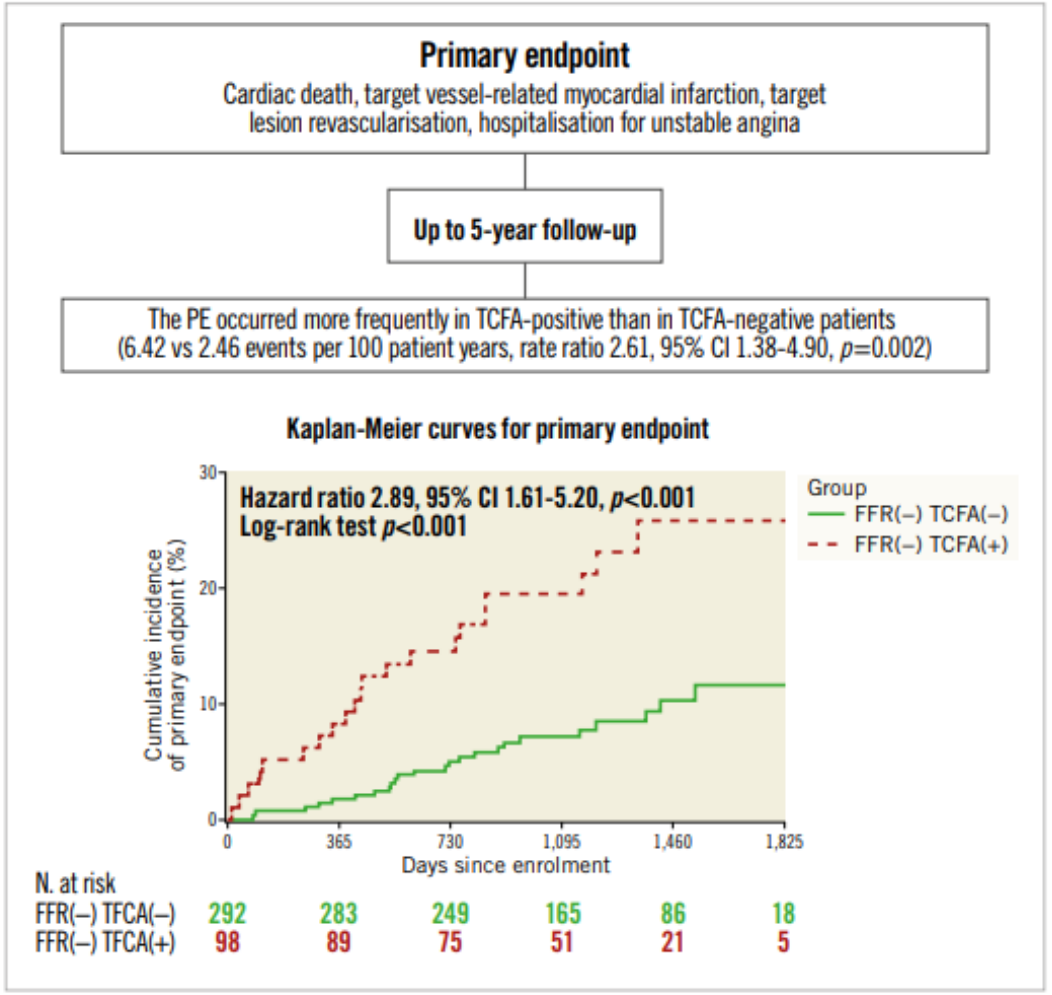
| | | | | |
|---|---|---|---|---|
| TCFA | 98 | 88 | 86 | 44 |
| No TCFA | 292 | 286 | 281 | 144 |

Circulation 2021

# Long-term outcomes of patients with normal fractional flow reserve and thin-cap fibroatheroma

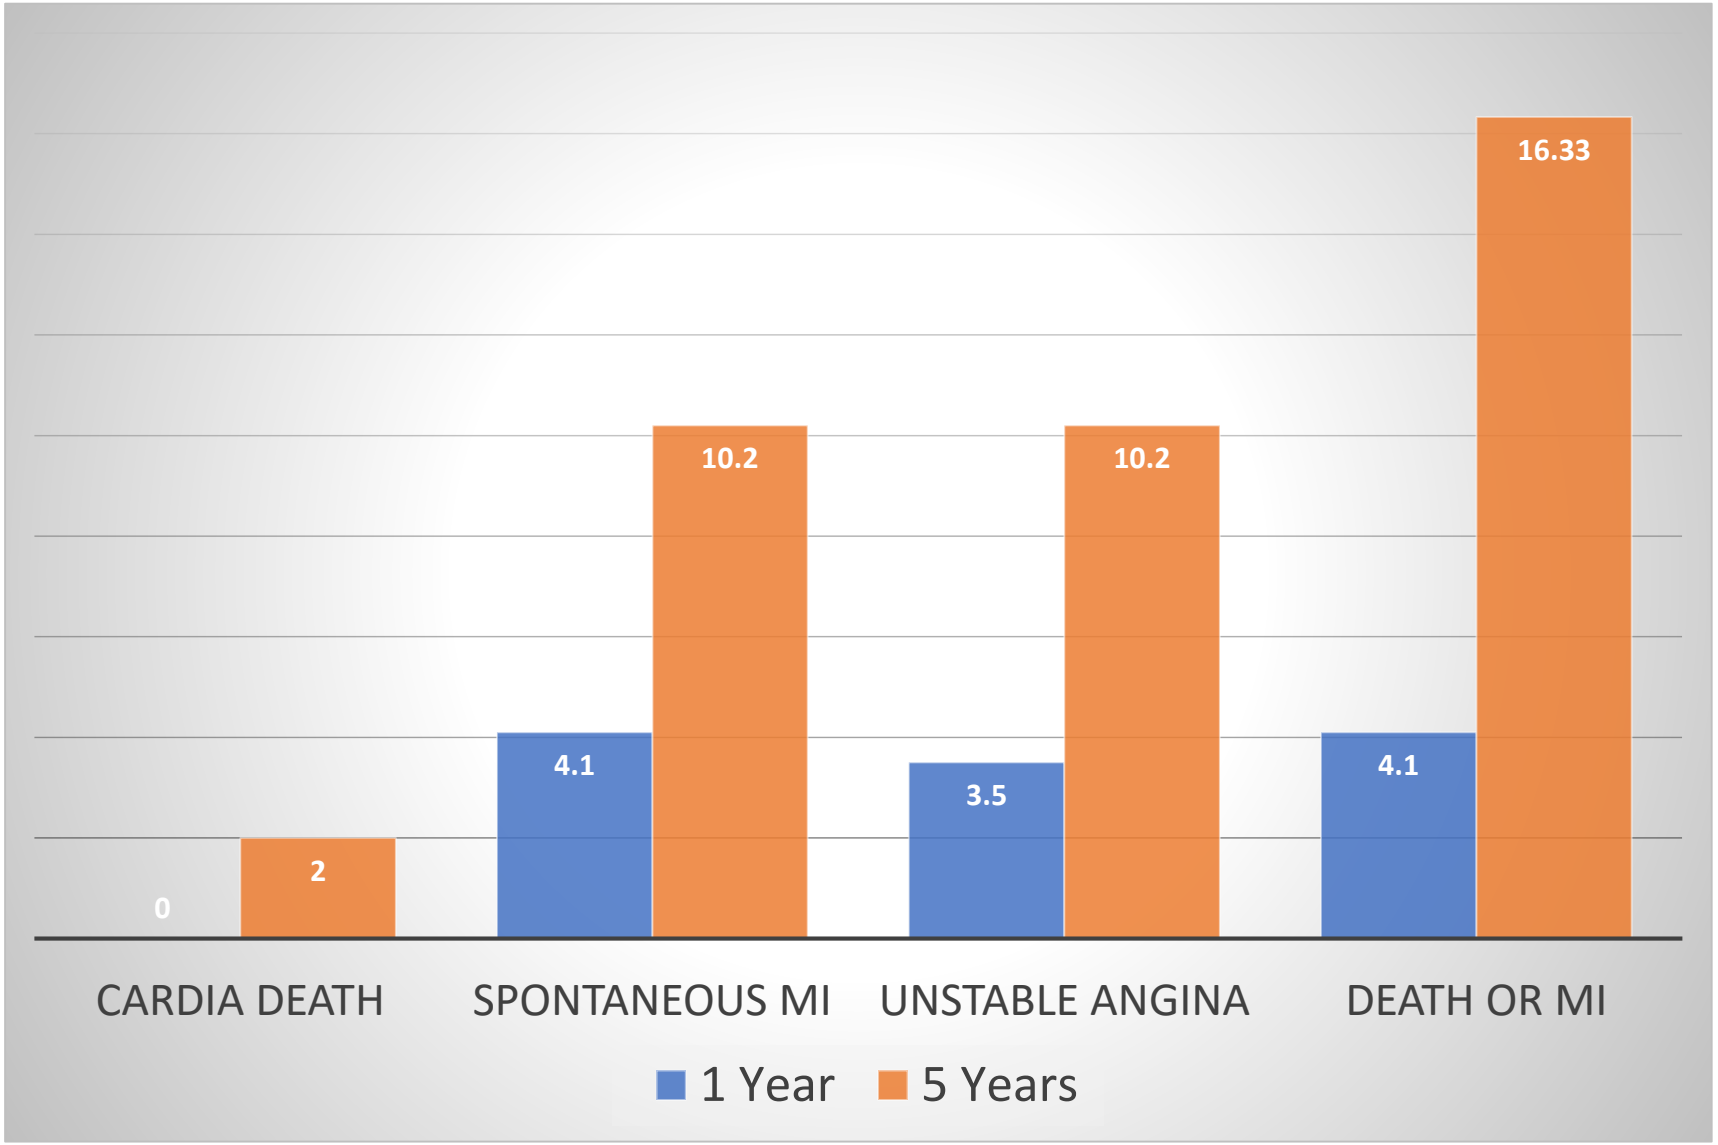
## Fabris et al. Eurointervention. In press





*Among patients with diabetes mellitus and fractional flow reserve (FFR)-negative non-culprit lesions enrolled in the COMBINE OCT-FFR study, patients with thin-cap fibroatheroma (TCFA) had a higher rate of the composite primary endpoint (cardiac death, target vessel-related myocardial infarction, target lesion revascularisation, hospitalisation for unstable angina) than those who were TCFA-negative, up to 5 years of follow-up. CI: confidence interval; FFR: fractional flow reserve; OCT: optical coherence tomography; PE: primary endpoint; TCFA: thin-cap fibroatheroma*

# COMBINE Study. Clinical end-point at 1 year and 5 years



# Is functional assessment so good for predicting hard events?

CCC 2022

- Treat with drugs

# Effects of Atorvastatin on Early Recurrent Ischemic Events in Acute Coronary Syndromes

## The MIRACL Study: A Randomized Controlled

**Figure 4.** Risk Ratio Plot

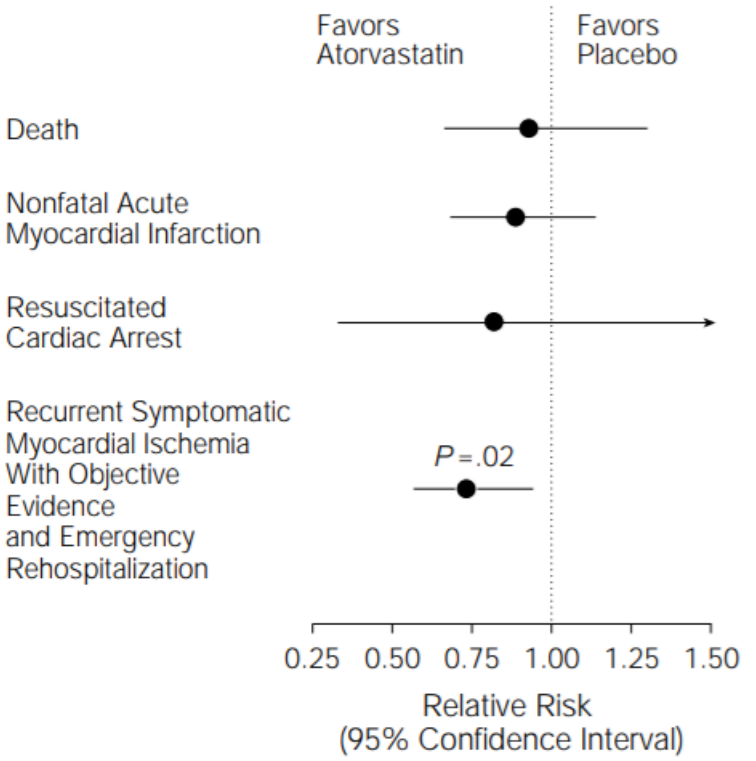

**Figure 3.** Kaplan-Meier Estimates of Primary Outcomes

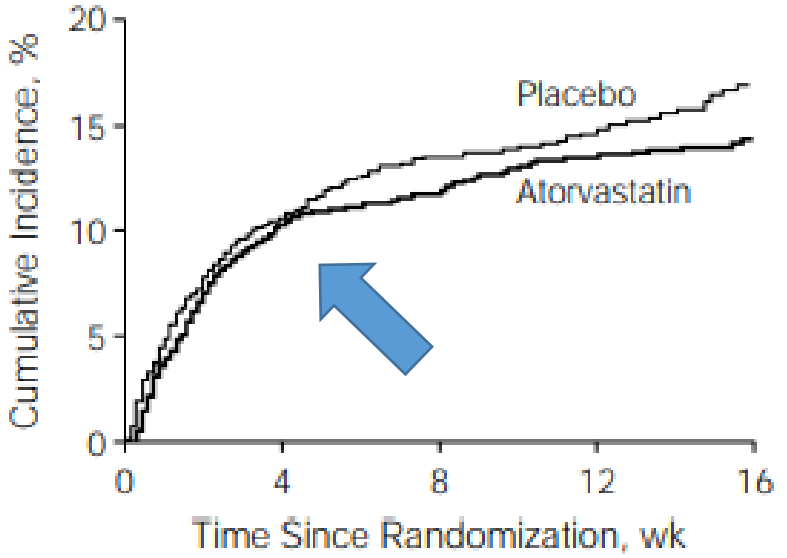

| No. at Risk | | | | | |
|---|---|---|---|---|---|
| Atorvastatin | 1538 | 1381 | 1351 | 1323 | 518 |
| Placebo | 1548 | 1384 | 1338 | 1318 | 473 |

The relative risk of the composite outcome in the atorvastatin group compared with the placebo group was 0.84 (95% confidence interval, 0.70-1.00; $P=.048$), based on a Cox proportional hazards analysis. The decrease in number at risk at 16 weeks reflects the fact that many patients completed the study within the days immediately preceding 16 weeks.
